

PlaySpace poster download service

Option A: IdeaFest IT deploys the supplied Worker and private R2 storage in the IdeaFest Cloudflare account. The PlaySpace kiosk remains local and connects to the final IdeaFest hostname.

Required final result

A public HTTPS origin such as <https://poster.ideafest.id>. The QR code and visitor download page will use this hostname.

Scope

- IdeaFest IT owns the Worker, R2 bucket, Custom Domain, access, usage, and logs.
- The developer owns the local kiosk deployment and points it to the final HTTPS origin.
- The R2 bucket remains private; the Worker serves poster URLs.

Files supplied

PlaySpace_Worker.js	Separate copy-paste deployment source supplied with this guide.
This PDF	Setup sequence, ownership, acceptance test, and handoff checklist.

Cloudflare resources

Worker	Suggested name: playspace-poster-api
R2 bucket	Suggested name: playspace-posters
R2 binding	Must be named exactly: POSTERS
Lifecycle	Delete uploaded objects after 1 day
Custom Domain	IdeaFest IT confirms the final hostname

Cloudflare setup

1

Create private R2 storage

Create an R2 bucket. Keep public bucket access disabled. Add a lifecycle rule that deletes uploaded objects after 1 day.

2

Create the Worker

Create a JavaScript Worker. Replace the starter code with the separately supplied PlaySpace_Worker.js, then deploy it.

3

Bind R2

Add an R2 binding to the Worker. Set the variable name to POSTERS, select the new bucket, and deploy the binding change.

4

Attach the IdeaFest hostname

In Worker Settings - Domains & Routes, add the approved IdeaFest Custom Domain and wait for HTTPS status to become active.

5

Run the health check

Open `https://[hostname]/health`. Expected response: `{"ok":true,"storage":true}`.

Acceptance test

- Send the developer the final HTTPS origin.
- Developer connects the local kiosk and completes one poster.
- Scan the generated QR from a separate phone/network.
- Confirm the visitor page and PNG both use the IdeaFest hostname.
- Confirm the completed poster appears in the kiosk Home examples.

Completion message to send

Hostname: `https://`_____

Worker deployed: Yes / No

POSTERS binding active: Yes / No

Health check passed: Yes / No
